The station started downloading data but then stopped and/or dropped the WiFi connection. What's wrong?

This may mean your battery voltage is too low. To check the battery voltage, use the station screen interface to go into the Readings menu, then go down to the second reading with "[]" next to it (if you click the middle button, it'll say "battery_vbus"). If the battery is low, you'll see a number less than 3.55 V here. If the issue is being caused by a low battery, follow the instructions in [The station screen is showing an "L" or "X" where the battery indicator is. What's wrong?](#)
